

Study on Physical Health Intervention of Students in Yunnan Minzu University

Hanglin Yu

Yunnan University for Nationalities, Kunming 650100, China.

Abstract: College students have been playing a pioneering role in the whole society and are the main force of social development^[1]. One of the tasks of the school is to promote the physical and mental health of students, which is related to the future development of the country and society. However, in recent years, the physical health of students in China is declining. Based on this, this paper takes the physical health test of students in Yunnan University for Nationalities and the actual situation of the school as the research object, and uses the method of literature and logical analysis to conduct in-depth research on this problem. The results show that there are some problems, and puts forward some feasible suggestions, It provides some reference value for Yunnan University for Nationalities students to improve their sports ability and enhance their physical health.

Keywords: Physical Health Test; Exercise Prescription; College Student; Intervention; Proposal

Introduction

In the process of the reform of colleges and universities in China, the problems of poor physical health and declining physical quality of college students have been fully exposed. Under the condition of continuously advocating quality education, only by taking a series of measures to improve the physical quality of college students can we lay a good foundation for improving the professional quality of college students and make them useful talents of the country and society^[2]. Based on this, we should first analyze the physical health of college students at this stage, then elaborate the shortcomings and problems in the current college physical education teaching, and finally put forward some feasible suggestions and opinions for the reform of college physical education teaching for reference.

1. Overview and function of physical health test

1.1 Overview of physical health testing

As we all know, the physical fitness test standards of all schools are implemented in accordance with the National Physical Training Standards, which is the basic requirement of the country for students' physical health. This standard is applicable to students in full-time primary schools, junior high schools, ordinary high schools, secondary vocational schools and ordinary colleges^[3]. Yunnan University for Nationalities also uses this standard to test students' physical health. This standard comprehensively evaluates students' physical health level from the aspects of body shape, function, physical quality, etc.

In colleges and universities, the objects of physical examination group division are: freshmen and sophomores as a group, Junior and senior form a group; The test content is: the height and weight in the body shape category, the vital capacity in the body function category, and the 50 meter running and sitting forward bending in the physical quality category are the common indicators for students of all grades. The bonus indicators for college students are: the pull up and 1000 meter running of boys, the 1 minute sit up and 800 meter running of girls. The test grades of students are divided into excellent, good, pass and fail.

Students can submit an application for postponing or exempting the test to the school due to illness or disability. After

being certified by the medical unit and approved by the sports teaching department, they can suspend or apply for exemption from the test, and fill in the Application Form for National Student Physical Health Standards Exempted from the Test, which is stored in the student file. The disabled students who really lost their sports ability and were exempted from the physical health test can still participate in the evaluation and award, and the physical test results at graduation should be marked with exemption.

1.2 The role of physical health testing

Educational function. Physical health test is an educational means to promote the healthy development of students' physique and encourage students to actively participate in physical exercise. The test indicators can reflect the basic conditions of body composition, cardiovascular system function, muscle strength and endurance, joint and muscle flexibility, etc.

Health function. To provide students with personalized health reports, so that students can exercise on the basis of accurate understanding of their own health. This test can also provide comprehensive and accurate statistical analysis data for education departments and schools, so that they can timely understand the physical health of students and take scientific intervention measures.

Boot function. It has a strong effect on guiding students to take physical exercise, and enables students to establish the ideological tool of lifelong physical exercise. At the same time, students can also obtain highly targeted exercise prescriptions, take physical exercises in different places according to local conditions and people, and improve their health level^[4].

2. Reflection on the physical health test of college students

2.1 Inadequate management of physical health test

First of all, the physical health test is not continuous. The physical testing room of the school is not open all the time, and there is no clear test time period. With the expansion of college students, the task of focusing on physical health testing is huge, which can not ensure that every student can put forward reasonable training plans and diet plans according to different people. Secondly, in the process of physical health testing, the corresponding safety measures should be improved. Because of the particularity of physical health testing, students will have physical injuries and safety problems due to various reasons, so the necessary safety measures should be improved; There are no special courses for students with basic diseases and congenital or acquired physical disabilities.

2.2 Physical examination lacks pertinence and timeliness

The results of the physical health test did not have a clear guiding role. The report did not indicate what shortcomings each student had, how to improve, and there was no reasonable exercise prescription and healthy diet planning. After the physical health test, most of the students did not achieve satisfactory results in long-distance running, pull up and sitting forward bending, but there was a lack of corresponding courses to enhance strength, confrontation, endurance and flexibility for students to learn after the test.

2.3 College students have insufficient understanding of physical health

After four years of college, many students do not know what is the difference between cardiopulmonary endurance training, aerobic training and anaerobic training. They lack the knowledge of scientific exercise and scientific and reasonable diet. Even after four years of college, their physical quality is not as good as that of high school.

3. Suggestions on the physical health test of our school

3.1 Reasonably arrange physical health test

First of all, after the physical examination and physical health test at the beginning of the semester, we will establish a health file and a health card for each student, establish a special physical health management organization, so that students can consult what kind of courses they are suitable for, select courses with the assistance of physical education teachers, and

provide rehabilitation courses and indoor sports theory courses for students with basic diseases and disabilities.

Secondly, the physical health test lasts for four years and has connectivity. The first physical health test will be conducted at the beginning of the first year of enrollment, and the second physical health test will be conducted at the beginning of the second academic year. The second test report will be compared with the report of the previous year, and the corresponding curriculum and diet plan will be re selected according to the actual situation. Until the last physical health test of the senior year reaches a certain score, the graduation standard can be reached.

Thirdly, make rational use of school resources, set up public physical education classes, establish sports clubs and sports associations and other forms, and reasonably allocate students after physical examination. The first two years of college are conducted in the form of public sports courses, and the second two years of college can freely choose to join clubs or associations according to the students' physical test data reports.

Finally, the physical testing room is open around the clock to facilitate students to monitor their exercise effects at any time, so as to make timely and reasonable changes, and also relieve the pressure of centralized testing.

3.2 Improve the corresponding curriculum after the physical health test

The courses are divided in detail. At present, the project settings of our public sports club are divided into: competitive confrontation projects: basketball, football, volleyball, table tennis, badminton, tennis, sanda, taekwondo, orienteering, billiards, etc; Performances: martial arts routines, social dance, aerobics, fitness and bodybuilding, national sports dance, etc; Items of self-cultivation: traditional health preservation, yoga, fitness running, etc; Health class, including sports theory, sports competition appreciation, etc. After the test, it can be subdivided into aerobic fat reducing clubs, anaerobic muscle increasing clubs, etc. according to the needs. With reference to the operation mode of commercial gyms, some group courses will be added, and students from physical education colleges will be arranged to act as coaches. One to one teaching will be conducted for members who need to specifically increase or reduce muscle fat, which can not only stimulate the interest of college students in exercise, but also drive students from physical education colleges to actively participate in it and keep pace with the times, Students become teachers, so that students of physical education can think at a higher level. At the same time, courses on health care, nutritional diet, sports rehabilitation and sports safety education are offered, and special indoor sports theory courses are offered for students with basic diseases and disabilities. According to their own conditions, some low-intensity outdoor training or indoor practice courses are arranged, so that they can also feel the benefits and fun of physical exercise. All courses require coaches, teaching assistants, group leaders and member students to perform their respective duties, actively participate in and form an overall linkage mechanism.

3.3 Build a fitness and health management app

The physical health management organization uses electronic information technology to create a mobile app, which is used to record students' health data, physical measurement data, write exercise and diet prescriptions, and select corresponding exercise courses. Students use their own student ID to register and log in the account, which is convenient for personal physical measurement management and course selection; At the same time, it is also convenient for teachers to manage students. After teachers log in, they can be used for students to clock in in class. Teachers can monitor students' learning and physical examination through terminal management, and open corresponding online and offline courses for students to learn. Teachers can also publish music lessons of various sports events on the app, add online courses of sports safety education, and improve students' safety awareness.

3.4 Pay attention to the safety of physical health test

During physical examination, stretchers, cardiac defibrillation instruments, first-aid kits and other medical supplies, medical and health first-aid stations and school doctors shall be set around the track and field and around the stadium. Every semester, PE teachers and coaches are required to learn and train first-aid knowledge, and obtain corresponding first-aid certificates, so as to ensure the life, health and safety of students in time in case of accidents during physical testing. At the same time, popularize the relevant safety first aid knowledge of students at the time of enrollment, so that students can establish safety awareness. Provide water supply and sports supplies at the sideline so that students can supplement in time

after physical examination.

3.5 Evaluate and timely adjust the curriculum

The quality of the course can be reflected by reference to the four year physical measurement data and the students' evaluation of the course. If the course is not ideal for a continuous period of time or the students' evaluation is poor, indicating that the students have no obvious effect after learning the course, they should consider changing the course.

4. Summary

Over the past 40 years of reform and opening up, the national economy, science and culture and competitive sports have made brilliant achievements. Why are college students getting worse? What did college students learn in college physical education? How should students study? How should teachers teach? How should physical health test be conducted? Facing a series of problems, the situation of physical education in colleges and universities is very serious. In order to break the declining situation of college students' physical health, college physical education curriculum and physical health testing process must be reasonably adjusted, in-depth research and re planning must be carried out. Only by fundamentally solving the drawbacks of college sports can we show the broad prospects of sports and fundamentally solve the major problem of the decline of college students' physical health^[5].
